The process of producing tea seed meal/granule/pellets is as follows:

- 1, Tea seed nuts go through a separator to remove any contaminants.
- 2, Cleaned tea seed nuts go through a heat machine, heated to 100°C to treat and dry.
- 3, Treated dried tea seed nuts are processed for oil extraction, oil is separated to another tank, and the tea seed residue “cake” is further processed.
- 4, The further processed tea seed cake is again processed for more oil extraction leaving the finished tea seed meal/granule/pellet.
- 5, Storage: in controlled dry storage
